Control Award Sponsored by Arm Submission Form

****Please turn in this sheet during your judge interview along with your engineering portfolio****

Team # 8696	**Team Name: Trobotix**

Autonomous objectives:

Score a pre-loaded cone on the nearest high junction past the signal sleeve.
Obtain a second cone from the cone stack and score on the nearest low junction.
Park in the correct zone based upon the signal sleeve.

Sensors used:

Drive Encoders x4 (built-in)	Accurate driving and navigation.
Magnetic Limits Switches x2	Consistent linear slide positioning (Autonomous).
Slide Encoder (built-in)	Specific linear slide positions inaccessible by magnetic limit switches.
REV Color Sensor V3	Read the signal cone.

Key algorithms:

Finite-State Machine	Control linear slide positioning via. magnetic limit switches without compromising the availability of other mechanisms.
Controller Input ROC	Squared direct controller input to create a linear, instead of constant, rate of change for driving. Provides a more “natural” feel.

Driver controlled enhancements:

Automatic linear slide positioning using encoders.
Convenient switching between automatic and manual slide positioning.
Improved controller sensitivity.

Driver interfaces:

Driver Configurable Autonomous	Text-based user interface displayed in telemetry. Allows drivers to configure autonomous behavior, such as which side of the field the robot is on.
Autonomous Scripting	Custom scripting language designed to be user-friendly. Turns the autonomous structure from code into a readable form. Executed by an “interpreter” written in Java. Especially useful for members outside of programming to calibrate the autonomous.

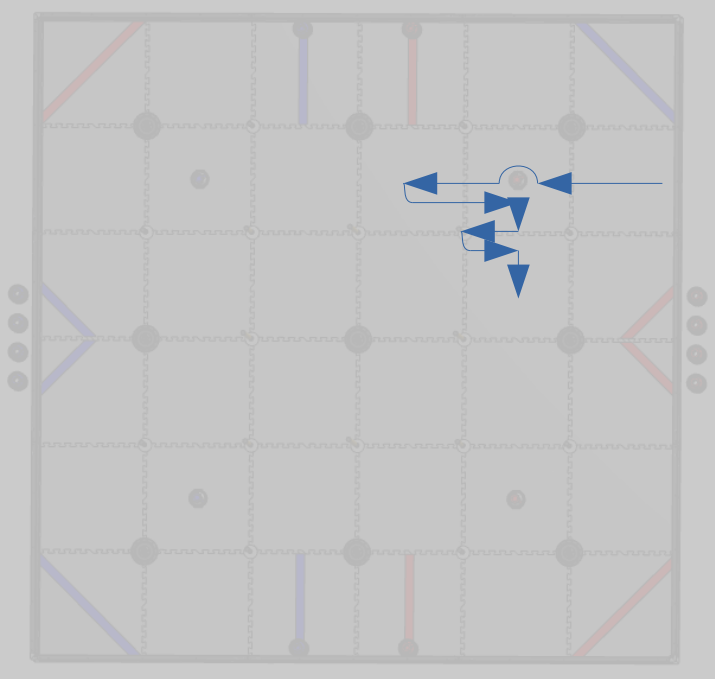
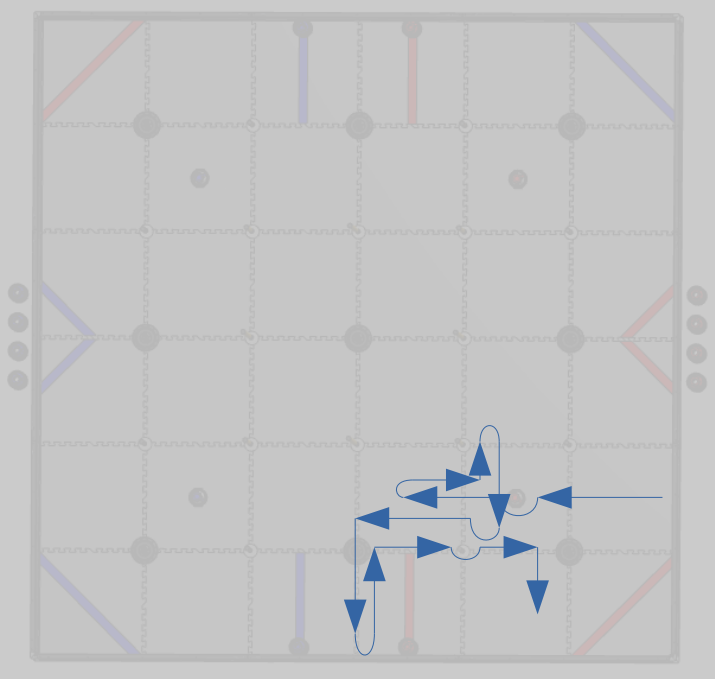
Autonomous program diagrams:

League Meet Sample Autonomous



1. Grab pre-loaded cone. Raise slide.
   Move forward. Read signal sleeve.
2. Push signal cone away.
3. Return to previous position.
4. Strafe to medium junction.
5. Position cone above junction. Drop cone.
6. Return to previous position.
7. Park in zone #1 (example).

Super Qualifier Sample Autonomous



1. Grab pre-loaded cone. Raise slide.
   Move forward. Read signal sleeve.
2. Push signal cone away.
3. Return to previous position.
4. Strafe right to medium junction. Drop cone.
5. Return to previous position.
6. Move forward. Turn -90 degrees.
7. Move to cone stack. Grab cone. Raise slide.
8. Return to previous position.
9. Strafe to low junction. Drop cone.
10. Strafe left.
11. Park in zone #1 (example).
